

# WEBSITE HOSTING

## What's It All About?

### DCT HOST'S SERVER

At DCT Host, we have a server that we use for all our website hosting clients. Every website hosting client is placed onto this server, and each client has their own slice of the server.

### GETTING TO KNOW YOUR NEIGHBOURS

Just because you're on the same server as other clients, it does not mean they can access your files or data, and you can't access theirs. In this sense, you'll often feel like you've got the entire server to yourself!

### DOMAINS

DCT Host's server has an IP attached to it. When people visit this IP and the username that relates to your slice on the server, your website files will show. However, you don't want people typing in your IP each time, so you buy a domain and point that to the IP. This means people can type in your domain to view your website files.

### WHAT IS YOUR WEBSITE?

Simply put, your website is a group of files. These files will typically be HTML and CSS files, however you may have other file types depending on what your website does. Our server recognises these files and shows them as a website rather than as a bunch of code.

### EDITING YOUR FILES

Editing your files is easy! We provide cPanel for all our clients, which is a simple interface you can use to upload, edit and delete files, among other things.
